

#ScholarStrike

September 8-9, 2020

is an action inspired by the NBA, WNBA, Colin Kaepernick and other athletes, to underscore the urgent importance of addressing racism and injustice in the United States. Conceived via a tweet by Anthea Butler, this is designed to call awareness to the racial climate in America, and the rash of police shootings and racialized violence.

Scholar Strike is both an action, and a teach-in. Some of us will, for two days, refrain from our many duties and participate in actions designed to raise awareness of and prompt action against racism, policing, mass incarceration and other symptoms of racism's toll in America.

Scholar Strike is open to everyone to participate in on college and university campuses- faculty, staff, grad students, and administrators who are committed to anti-racism, and advocating for racial justice for BIPOC in all areas of society.

Post

we'll go over the following next week - but for now...

< HTML >

block vs. **inline** display

The key to understanding how **HTML** + **CSS** works is to imagine that there is an invisible box around every **HTML** element.

Block level elements are outlined w/ red + inline elements in green.

<body> creates 1st box, then **<h1>, <h2>, <p>, <i> + <a>** each create their own boxes within it.

The Cottage Garden

The *cottage garden* is a distinct style of garden that uses an informal design, dense plantings, and a mixture of ornamental and edible plants.

The Cottage Garden originated in [England](#) and its history can be traced back for centuries, although they were re-invented in 1870's England, when stylized versions were formed as a reaction to the more structured and rigorously maintained [English estate gardens](#).

The earliest cottage gardens were more practical than their modern descendants, with an emphasis on vegetables and herbs, along with some fruit trees.

< HTML >

3 categories of HTML elements

1 - **block**: large blocks of content has height + width

`<p>, <h1>, <blockquote>, , , <table>`

2 - **inline**: small about of content, no height or width

`<a>, , ,
, , <time>`

a. **inline block**: inline content w/ height + width

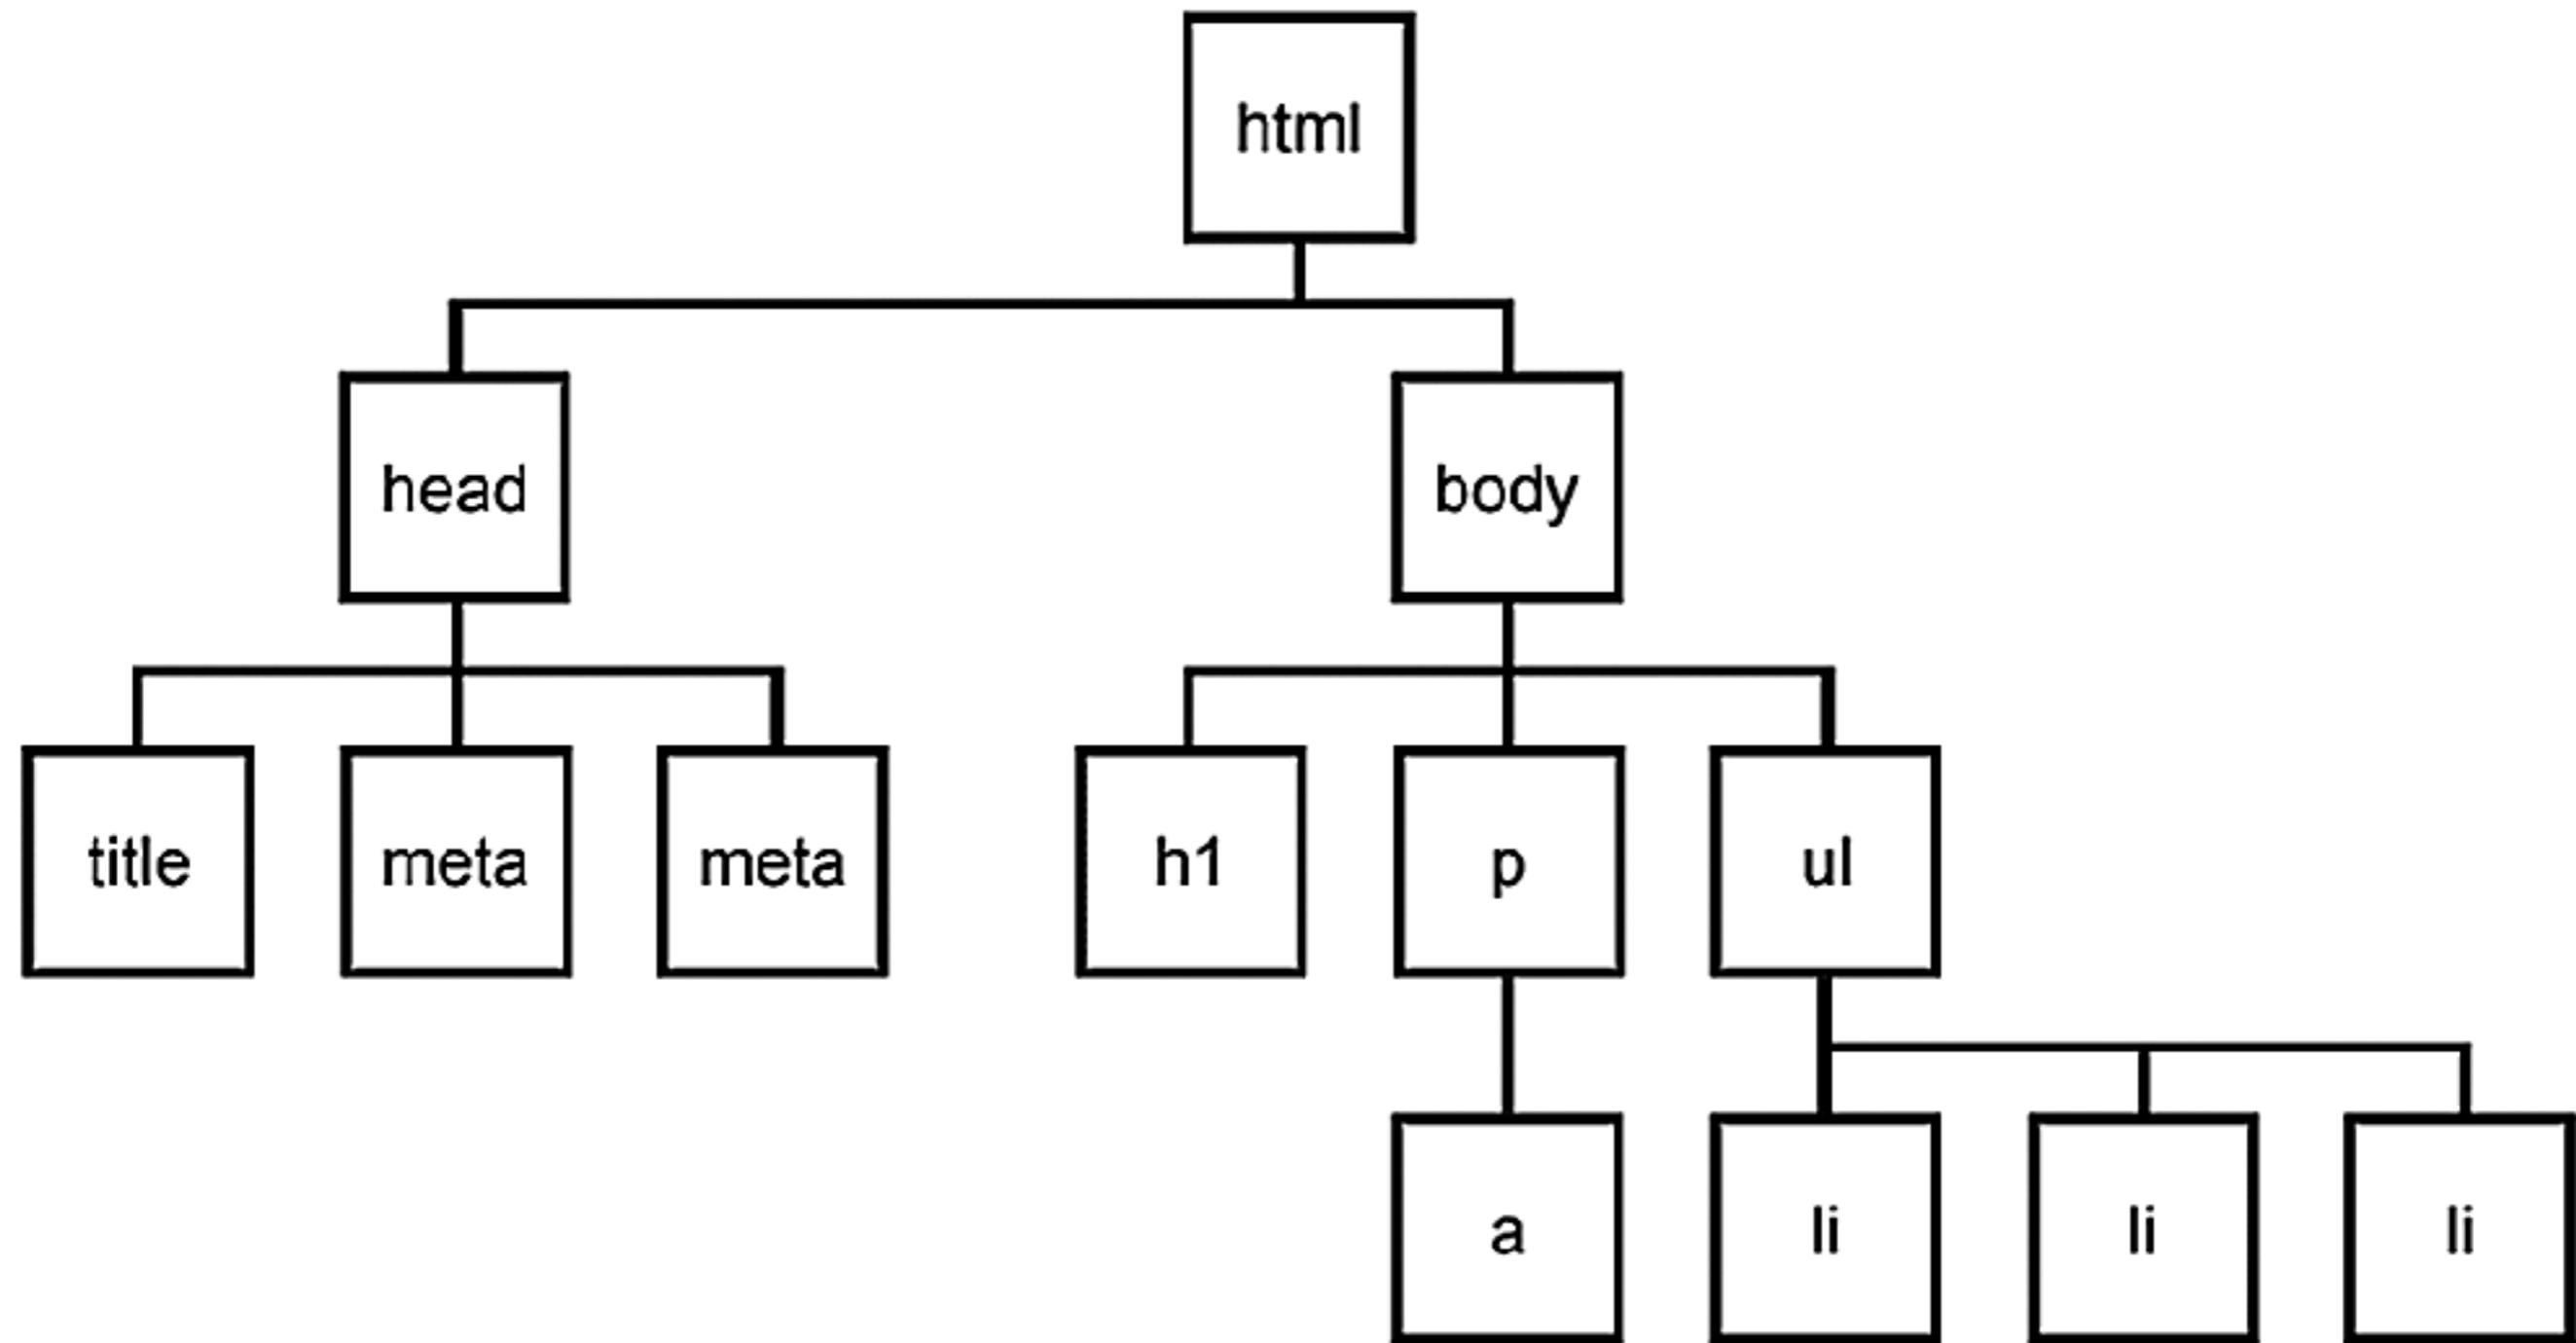

3 - **metadata**: information abou the page, usually not visible

`<title>, <meta>, <script>`

HTML - Hyper Text Mark Up

```
<!DOCTYPE html>
<html>
  <head>
    <title>💻 Internet + Web Week 1</title>
  </head>
  <body>
    this is a webpage of wonderful text
  </body>
</html>
```

Parent / Child Element Structure

Parent + Child

```
<!doctype html>
  <head>
    <title> Week 1 </title>
  </head>
  <body>
    <div>
      Here's a Great Site.
    </div>
  </body>
</html>
```

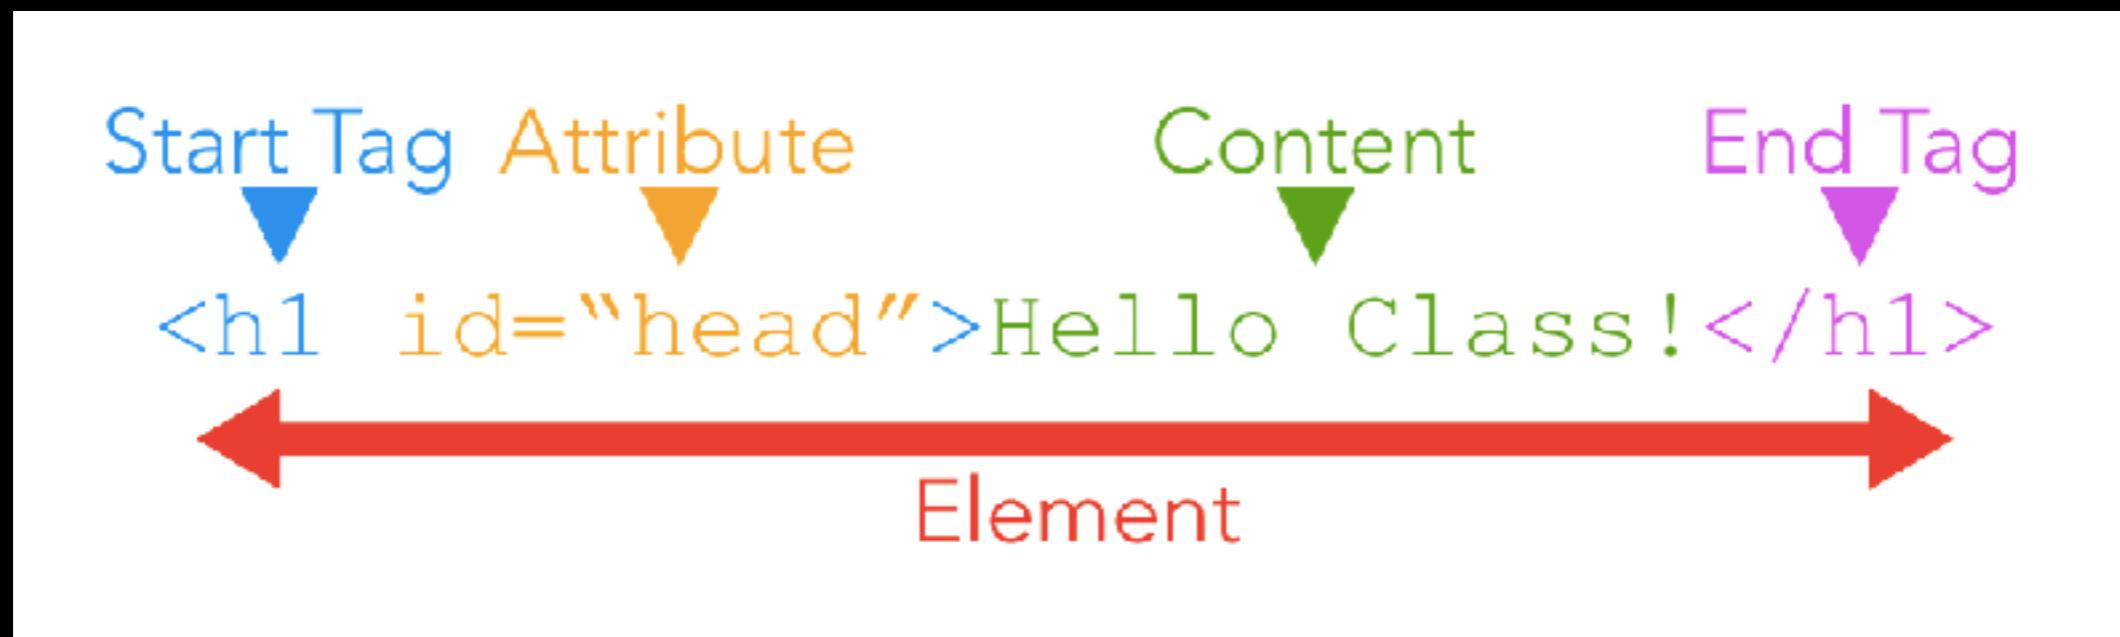

head is the parent of title

div is the child of body

body is the child of html

HTML Elements / Tags, Attributes, Content

- Elements and tags used interchangeably

The `<head>` element contains the metadata for a web page. Metadata is information about the page that isn't displayed directly on the web page. Unlike the information inside of the `<body>` tag, the metadata in the head is information about the page itself.

Text tags

- **h1, h2, h3, h4, h5, h6** are text tags for headings
- **p** is a tag for paragraphs
- **b** is for bold, **i** is for italics
- **** is for **bold** **** is for *italics*
- **ul, ol, li** are used for making lists
 - **ul**: unordered lists
 - **ol**: ordered lists
 - **li**: an individual list tag
- **
** will break to a new line

```
<h1>Heading 1</h1>
<h2>Heading 2</h2>
<h3>Heading 3</h3>
<h4>Heading 4</h4>
<h5>Heading 5</h5>
<h6>Heading 6</h6>
```

`<div>`s can contain any text or other HTML elements, such as links, images, or videos. Remember to always add two spaces of indentation when you nest elements inside of `<div>`s for better readability.

Semantic HTML

HTML should be coded to represent the data that will be populated and not based on its default presentation styling. Presentation (how it should look), is the sole responsibility of CSS.

Some of the benefits from writing semantic markup are as follows:

- Search engines will consider its contents as important keywords to influence the page's search rankings (see SEO)
- Screen readers can use it as a signpost to help visually impaired users navigate a page
- Finding blocks of meaningful code is significantly easier than searching through endless divs with or without semantic or namespaced classes
- Suggests to the developer the type of data that will be populated
- Semantic naming mirrors proper custom element/component naming

Semantic elements

<p>

<h1> - <h6>

<main>

dominant content of the <body> element

<article>

A document, page or site. This is usually a root container element after body

<section>

Generic section of a document

<header>

Intro section of a document

<footer>

Footer at end of a document or section

<nav>

Navigational section

Use these **before** div when appropriate.

Semantic elements

<aside>

represents a portion of a document whose content is only indirectly related to the document's main content. Asides are frequently presented as sidebars or call-out boxes.

<details>

creates a disclosure widget in which information is visible only when the widget is toggled into an "open" state.

<figcaption>

represents a caption or legend describing the rest of the contents of its parent <figure> element.

<mark>

represents text which is marked or highlighted for reference or notation purposes, due to the marked passage's relevance or importance in the enclosing context.

<summary>

element specifies a summary, caption, or legend for a <details> element's disclosure box. Clicking the <summary> element toggles the state of the parent <details> element open and closed.

<time>

represents a specific period in time.

The **** tag will generally render as *italic* emphasis.

The **** will generally render as bold emphasis.

**
**

The line break element is unique because it is only composed of a starting tag. You can use it anywhere within your HTML code and a line break will be shown in the browser.
